### Harnessing Efficient Genetic Improvement to Maximize Economic Return

Adriana Artiles aartiles@aquatechcenter.com

### THE CENTER FOR AQUACULTURE TECHNOLOGIES

## SERVICES

Our expertise spans genotyping, genomics, breeding, and genome editing, catering to an extensive range of aquatic species. The company's integrated services support businesses of all sizes, accelerating growth, promoting environmental stewardship, and advancing the industry.

### BREEDING

### **GENOME EDITING**

 $\mathbf{\mathbf{\hat{o}}}$ 

# Main questions that producers have about genetics:

- What can I do to improve my genetics?
- How much will it cost?
- Is it worth it?

### **Breeding designs –** from simple to complex

The Center for Aquaculture Fechnologies | www.aquatechcenter.com

-

The process of improving one or more desirable traits of a cultured species through the selection of superior parents.

![](_page_4_Picture_5.jpeg)

![](_page_4_Picture_6.jpeg)

### **Selective Breeding Programs**

A breeding program is the implementation of a selective breeding strategy and associated tools.

Typically designed to maximize economic productivity for a commercial aquaculture producer.

The Center for Aquaculture Technologies | www.aquatechcenter.com

#### The cycle of a breeding program

![](_page_5_Figure_5.jpeg)

![](_page_5_Picture_7.jpeg)

### Benefits of a good genetic foundation and good diversity

![](_page_6_Figure_1.jpeg)

![](_page_6_Figure_2.jpeg)

Trait (for instance, weight, resistance)

![](_page_6_Figure_5.jpeg)

Trait (for instance, weight, resistance)

![](_page_6_Picture_7.jpeg)

### **Benefits of a Breeding Program**

![](_page_7_Figure_1.jpeg)

#### intensity \* accuracy \* heritable proportion $\Delta G =$ **Generation time**

The Center for Aquaculture Technologies | www.aquatechcenter.com

- Competitiveness
- Production improvements
- Economic gains
- Compounding benefits
- Routine component of a mature agribusiness

TIME

![](_page_7_Picture_11.jpeg)

### HOW GENOTYPING SUPPORTS BREEDING PROGRAMS

### Genotyping can support all breeding strategies

SNPs (Single Nucleotide Polymorphisms) are a type of genetic marker

Genotyping tools look at varying numbers of SNP's (their 'density')

Different breeding strategies require different densities of genotyping tools

#### AQUAARRAY

![](_page_8_Picture_6.jpeg)

Up to 1,000 SNPs

- parentage assignment
- genetic diversity assessment
- broodstock population structure
- inbreeding monitoring

#### AQUAARRAY

![](_page_8_Picture_13.jpeg)

#### **Up to 10,000 SNPs**

- includes LD applications
- traceability management
- imputation to HD dataset

#### AQUAARRAY

![](_page_8_Picture_19.jpeg)

#### 10,000 to Millions of SNPs

- LD & MD applications
- genomic selection
- marker-assisted selection
- marker discovery

![](_page_8_Picture_26.jpeg)

![](_page_9_Picture_0.jpeg)

## Types of Breeding Programs Mass Selection (Growth)

Easy to implement 

- Very low investment
- Molecular markers can help manage the inbreeding/variability
- Inbreeding and loss of diversity risk
- Can only be implemented in traits measured directly on the candidates
  - In most cases it can only be implemented for one trait

#### Selected individuals to produce the next generation

![](_page_10_Picture_8.jpeg)

#### "Ecuadorian model"

Next generation typically goes through pond environment`

- Mass Spawning
- 2. Evaluation for Growth and "Survival"
- 3. Selection of Best Individuals based on phenotype
- 4. Must manage inbreeding
- 5. Can have very high intensity

![](_page_10_Picture_19.jpeg)

## Types of Breeding Programs Mass Selection (Disease)

Easy to implement 

- Very low investment
- Molecular markers can help  $(\mathbf{H})$ manage the inbreeding/variability
- Inbreeding and loss of diversity risk
- Can only be implemented in traits measured directly on the candidates
- In most cases it can only be implemented for one trait

#### Selected individuals to produce the next generation

![](_page_11_Picture_8.jpeg)

#### "Ecuadorian model"

Next generation typically goes through pond environment`

- Mass Spawning
- 2. Evaluation for Growth and "Survival"
- 3. Selection of Best Individuals based on phenotype
- 4. Must manage inbreeding
- 5. Can have very high intensity

![](_page_11_Picture_19.jpeg)

## Types of Breeding Programs: Family Selection (Growth)

- $\oplus$ Improvement of traits is very efficient
- Several traits can be improved at the  $\bigcirc$ same time
- Traits can be measured indirectly to  $\mathbf{+}$ subsets of family members without exposing NBC to disease
- Requires significant amount of infrastructure/investment
- Data management and analysis is critical for the best results
  - Large number of families are needed for best management of inbreeding/variability

No environmental exposure

#### Best families mated to produce the next generation

![](_page_12_Picture_9.jpeg)

Families typically selected based on performance in breeding nucleus, or in performance of siblings in disease trials

### "Biosecure family nucleus"

- Controlled mating to produce Families
- 2. Evaluation of Families for key traits
- 3. Selection of best Families
- 4. Can't select within Families for commercial growth outside nucleus
- 5. Can select within family for growth inside nucleus

![](_page_12_Picture_19.jpeg)

![](_page_12_Picture_24.jpeg)

## Types of Breeding Programs: Family Selection (Disease)

- $\oplus$ Improvement of traits is very efficient
- Several traits can be improved at the **H** same time
- Traits can be measured indirectly to  $\bigcirc$ subsets of family members without exposing NBC to disease
- Requires significant amount of infrastructure/investment
- Data management and analysis is critical for the best results
  - Large number of families are needed for best management of inbreeding/variability

No environmental exposure

#### Best families mated to produce the next generation

![](_page_13_Picture_9.jpeg)

Families typically selected based on performance in breeding nucleus, or in performance of siblings in disease trials

### "Biosecure family nucleus"

- Controlled mating to produce Families
- 2. Evaluation of Families for key traits
- 3. Selection of best Families

4. Can't select within Families for commercial growth outside nucleus

5. Can select within family for growth inside nucleus

![](_page_13_Picture_18.jpeg)

![](_page_13_Figure_21.jpeg)

![](_page_13_Picture_22.jpeg)

### **Types of Breeding Programs: Genomic Selection (Growth)**

- Improvement of traits is the fastest,  $\bigcirc$ with the best ROI
- Several traits can be improved at the  $(\mathbf{H})$ same time
- Traits can be measured indirectly to  $\bullet$ subsets of family members without exposing NBC to disease
- Has the highest cost to implement
- Requires management of large data sets and complex analysis
- Cost for genotyping at high density of molecular markers; ROI must be clear

mated to produce the next generation

![](_page_14_Picture_8.jpeg)

Can be in Breeding Nucleus or applied to Mass Selection; delivers within and among family selection

### Best individuals based on Genomic Breeding Value

#### **Genomic Selection**

- 1. Mass Spawning or controlled mating
- 2. Evaluation for key traits
- 3. Selection of best Individuals
- 4. Control of inbreeding and diversity
- 5. Very accurate and can scale intensity

![](_page_14_Picture_18.jpeg)

### Types of Breeding Programs: Genomic Selection (Disease)

- Improvement of traits is the fastest, (+)with the best ROI
- Several traits can be improved at the  $(\mathbf{H})$ same time
- Traits can be measured indirectly to  $\bullet$ subsets of family members without exposing NBC to disease
- Has the highest cost to implement
- Requires management of large data sets and complex analysis
- Cost for genotyping at high density of molecular markers; ROI must be clear

mated to produce the next generation

![](_page_17_Picture_1.jpeg)

The Center for Aquaculture Technologies | www.aquatechcenter.com

### Thinking about the return on investment in genetic improvement

![](_page_18_Picture_0.jpeg)

## Improving your genetics needs investment in technology, people and infrastructure

### In simple terms – will enough returns be generated to justify this investment?

![](_page_18_Figure_5.jpeg)

![](_page_18_Picture_6.jpeg)

![](_page_18_Picture_7.jpeg)

![](_page_19_Picture_0.jpeg)

![](_page_19_Picture_1.jpeg)

![](_page_19_Picture_2.jpeg)

Deciding whether to undertake a new project Choosing between different options for a project

The Center for Aquaculture Technologies | www.aquatechcenter.com

![](_page_19_Picture_6.jpeg)

![](_page_19_Picture_7.jpeg)

Understanding potential return on Understanding the impact of investment and how to measure this investments on business value

![](_page_19_Picture_9.jpeg)

![](_page_19_Picture_10.jpeg)

![](_page_19_Picture_11.jpeg)

### **Investment Return Calculation** Internal Rate of Return (IRR)

- The rate of growth that an investment is expected to generate annually
- Takes into account initial investment, cash flows, and time cost of money
- Value can be thought of as the amount of return an investment can generate
- Based on assumptions of performance, so return is not discounted for risk

![](_page_20_Picture_6.jpeg)

![](_page_20_Picture_7.jpeg)

### Low challenge - Growth dominant

![](_page_21_Figure_1.jpeg)

The Center for Aquaculture Technologies | www.aquatechcenter.com

Mass selection gives higher returns at small volumes but Genomic programs were more profitable for medium and large breeding programs.

![](_page_21_Picture_6.jpeg)

### High challenge - multiple traits

![](_page_22_Figure_1.jpeg)

GS is preferred strategy even at smaller scales when looking at challenging environments. Returns are higher at each production point compared to low challenge scenario.

![](_page_22_Picture_4.jpeg)

![](_page_23_Figure_0.jpeg)

Mass selection gave higher returns at small volumes but Genomic programs were more profitable for medium and large breeding programs.

The Center for Aquaculture Technologies | www.aquatechcenter.com

![](_page_23_Figure_4.jpeg)

GS is preferred strategy even at smaller scales when looking at challenging environments. Returns are higher at each production point compared to low challenge scenario.

Economic analysis indicates that the cost of not implementing Genomic Selection is often much higher than choosing a Genomic Selection strategy

![](_page_23_Picture_7.jpeg)

- A selective breeding program is worth the investment
- Benefits compound over time; there is a cost to not acting
- Mass selection is a good strategy when only selecting for growth
- Selection for indirect or multiple traits is significantly more economical when using a genomic approach
- Genomic Selection strategies will become more and more common (as tools become available)
- The economic return on genetic improvement is significant when the right approach is applied in the right environment
